

AMENDMENTS TO THE CLAIMS

Please add or amend the claims to read as follows, and cancel without prejudice or disclaimer to resubmission in a divisional or continuation application claims indicated as cancelled:

1. (Currently Amended) A configuration for detecting optical signals, comprising:

a planar light circuit including an optical channel[[;]], said planar light circuit having a trench formed therein and interrupting said optical channel;

a support submount attached to said planar light circuit; and

a detection unit disposed on said support submount to detect ~~in said trench detecting~~ optical signals in said optical channel.
2. (Currently Amended) The configuration according to claim 1, wherein said trench in the planar light circuit terminates said optical channel.
3. (Cancelled)
4. (Currently Amended) The configuration according to claim [[3]] 1, including a row of said detection units disposed on said support submount, said detection units being photodiodes.
5. (Original) The configuration according to claim 4, including a second row of photodiodes on said support submount offset from said first row.
6. (Original) The configuration according to claim 4, wherein:

said planar light circuit has a plane; and

said photodiodes each have a bevel angled to said plane of said planar light circuit.
7. (Currently Amended) The configuration according to claim [[3]] 1, including metalized areas on said planar light circuit; said support submount being mounted on said optical circuit and contacting said optical circuit via said metalized areas.

8. (Original) The configuration according to claim 7, including solder bumps on said support submount for connecting to contact areas of the optical circuit.
9. (Original) The configuration according to claim 7, including gold metalizations on said support submount, said gold metalizations simultaneously serving as a conductor track and as mounting areas for said detection unit, said solder bumps, and bonding wires.
10. (Original) The configuration according to claim 4, including a common metalization connecting said photodiodes to said support submount.
11. (Currently Amended) The configuration according to claim ~~[[3]]~~ 1, wherein said support submount is optically transparent.
12. (Original) The configuration according to claim 4, wherein said photodiodes are laser-soldered on said support submount from below through said support submount.
13. (Original) The configuration according to claim 1, wherein said trench formed in said planar light circuit complements said detection unit, said detection unit being inserted tightly into said trench.
14. (Original) An attenuator apparatus, comprising:
 - an attenuator unit;
 - a multiplicity of optical principal channels carrying optical signals having an optical power, respectively passing through said attenuator unit, and having a respective associated monitor channel receiving a particular percentage of the optical power in said associated principal channel; and
 - a configuration detecting the optical signals in said monitor channels, including:
 - a planar light circuit including an optical channel;
 - said planar light circuit having a trench formed therein and interrupting said optical channel; and
 - a detection unit being disposed in said trench and detecting the optical signals in said optical channel.

15. (Original) The attenuator apparatus according to claim 14, wherein said monitor channels run parallel to said respective optical principal channels without crossing one another or said principal channels.

16. (Original) The attenuator apparatus according to claim 14, wherein said principal channels respectively run along said trenches for said detection units and are undisturbed in said planar light circuit.

17. (Currently Amended) A method for manufacturing a configuration for detecting optical signals in an optical channel in a planar light circuit, which comprises the following steps:

- providing a support submount;
- mounting a detecting unit on the support submount;
- providing a planar light circuit with an optical channel;
- interrupting the optical channel by forming a trench in the planar light circuit;
- placing the support submount on the planar light circuit using flip-chip mounting; and
- inserting [[a]] said detection unit into the trench.

18. (Currently Amended) The method of claim [[16]] 17, which further comprises, before the mounting step:

- applying and structuring a metalization to the submount carrier;
- applying and structuring a soldering stop layer to the submount carrier; and
- applying solder bumps to the submount carrier.

19. (New) The configuration of claim 1, wherein said support submount is attached to said planar light circuit by flip-chip mounting.

20. (New) The configuration of claim 1, wherein said detection unit is not directly attached to said planar light circuit.
